

Meeting Details

- Date: May 05-30-2022
- Time: 4pm - 5pm
- Attendees: Mudit, Jasmine, David (from team 10)

Notes

- Looked at branches
 - Should merge into master (or at least check if we will have merge conflicts)
- CI/CD pipeline
 - Consider having only 1 yml file that makes the pipeline work on both master and develop
- Firebase
 - Why use firebase instead of heroku or netlify?
 - Consider adding ADR to explain this decision
 - Consider using the firebase database to store task list, songs, etc.
- Looked through code
 - Went through original code and spoke about js and css refactor
 - task-list.js
 - inputSanitizer() used only once
 - background-music.js
 - Why are we exporting only setBackgroundMusic()?
 - Used eventListeners to do other stuff
 - Would we loop over the same track or play the next track?
 - Right now we are playing the next track. Might be better to loop over the same track?
 - skins-themes.js
 - Should add more comments.
 - localStorage.js
 - Clarify what 'objName' refers to
 - Test the code to ensure it works (we weren't sure how it was implemented)
- Discussed timer throttling task and implementation
- Went over Wiki
- Testing
 - Showed markdown for unit tests
 - Need to discuss e2e testing. Perhaps implement only e2e if we can't do both?
